I was reading a piece of code where base.dispose() is being called and I couldn't understand what was the need for it. protected virtual void Dispose(bool disposing) { if (disposing) { if (logFile!= null) { logFile.Dispose(); } // Other code } base.Dispose(disposing); } I could understand it's a method being called and hence the first "base.Dispose" is being called. Could you please elaborate on the need of calling the base.Dispose? A: This is happening because the Dispose method of the Logger class (which you mentioned) is virtual. This means that the programmer of the Logger class is deciding that there should be a specific way to dispose of this object, and it's doing so by calling the Dispose method of the current class, and then passing the execution on to the base class. That way, the garbage collector has a chance to dispose of the object (through the Dispose method that is being called), but the programmer gets
