With this tool you can:View, develop and manage best-of-class, custom 3D design applications for Windows, Linux, and UNIX platforms. Extensive development capabilities including geometry building, scripting, and support for an extensive list of files formats. System requirements - Two-dimensional or three-dimensional geometrical entities can be created using the geometry builder and may be converted to the supported file format. - To view and manage a design, use the file manager or viewer to access the design. The viewer can be used to view existing geometrical entities in the file(s) or to view and interact with a design that is already created. - Use the scripting engine to define custom applications and filters to be used during design. - Use the geometry builder to construct geometry and geometry groups. A geometry group can be constructed in a file of your choice. You can then assign the group to different entities, where the entities can be referenced from any text file, including an XML (XML) file that can be generated from a design that can be viewed in the viewer. Similarly, you can zoom in or out using the mouse scroll wheel. JT2Go features three measurement components, namely '3D', 'Single' and 'Double'. Other 'Tools' include 'PMI' (or 'Product Manufacturing Information', like 'Dimensions, Notes', 'Line Welds', 'Locators', 'Reference Geometry', 'Feature Control Frames', and others) and the 'Section 3D' that lets you adjust the X, Y and Z axes' positions. To conclude, JT2Go is a useful and efficient software solution that is meant to assist you in viewing JT files and other types of 3D designs, offering a wide range of tools and functions to simplify your job. jtoViewer - screen capture tool for JT files in the 2D Design Space With jtoViewer you can easily capture the screen, thus making it possible for 2D diagrams to be transferred between your office and your home PC, e.g. between CAD and CAM. The present invention relates to an apparatus and method for producing a high-fidelity, multi-channel, electronic music recording. More specifically, the present invention relates to the production of a high-fidelity electronic music recording that is produced simultaneously with a traditional acoustic music recording, and that utilizes digital electronic mixing and processing. The production of traditional acoustic music recordings often requires the use of a microphone and a player, the former producing a sound that is converted to electrical signals, the latter then performing the music upon a musical instrument, such as a piano, guitar, or drum kit. The music signals are amplified and mixed on a console to improve the overall sound. The final audible product
