Din 16742 Pdf 37 _VERIFIED_

Download

DIN Manuals/reference guides DIN 16742 DIN Manuals/reference guides DIN Manuals/reference guides Application of the Standard as Description of the testing and verification method/ing Method for verification of the engineering quality of thermoplastic mouldings. The purpose of this standard is to specify the engineering quality of plastics moldings. This standard does not deal with chemical aspects. This is Part 1 of a three part standard. This standard applies to finished moulded parts in which the surface finish is glossy. Part 2 applies to finished moulded parts in which the surface finish is satin. Part 3 applies to finished moulded parts in which the surface finish is matt. DIN 16742 is used mainly in Germany. This standard does not apply to applications in which the plastic is not plastics material. Where the standard applies to plastics, it also applies to thermoset plastics, provided they meet the requirements of the standard. This standard gives the requirements for the surface finish on the moulded products. The requirements set out in this standard are: the finished moulded part must be free from visible defects the finished moulded part must comply with the mechanical properties of the plastics to be used determined by testing and verifications. The verification of the surface finishes and the tests for basic mechanical properties are specified. A gloss condition must be achieved before acceptance or approval. All the required requirements are specified and covered by the standard. Testing Equipment 1 In this standard, the term production equipment is understood to mean all the equipment that is normally used for moulding plastics parts, such as moulds, core filling devices, measures for the definition of centre marks and so on. 2 The requirements are for the use of the reference procedures and for the test services for the quality control, which can be optionally used. 3 References used in this standard refer to the standards ISO 9000-1, ISO 9000-2, ISO 9000-3, ISO 9000-4, ISO 9000-5 and ISO 9000-6. 4 Differences in dimensions are reported to within +/- 0.05 mm as defined in ISO 8406-3:1996. 5 The figures in this standard are given to four significant figures. 1. Introduction 1.1 A gloss condition is always obtained in the final stage of the production process. It is achieved on the basis of the selection of the raw materials and the processing and applies to
