Optical coherence tomography (OCT) is a new technology for obtaining high-resolution images of living tissues in real time. The images are cross-sectional, three-dimensional and noninvasive. The present study was designed to assess the potential usefulness of OCT in the diagnosis and monitoring of living tissues during endoscopic and surgical procedures. OCT was performed in 115 human subjects, including 41 normal individuals, 39 upper gastrointestinal tract patients undergoing endoscopy, and 25 patients undergoing intra-abdominal surgery. The images of the free surface, submucosa and muscle

layer were processed and cross-sectional images of the gastrointestinal wall and peritoneum were reconstructed. Microscopic images were also obtained for comparison. OCT images clearly depicted the normal intestinal mucosa and submucosa, and revealed the mucosal layers of patients with various diseases and the fine structures of the submucosa and muscle layers. The extent of the mucosal lesions was clearly visualized as mucosal mosaicism or blurring of the mucosa. In several layers, the OCT images were superior to the microscopic ones. OCT can be used in both clinical and experimental situations for the diagnosis and follow-up of diseases of the gastrointestinal tract, and it may be used in such procedures as resection or anastomosis during surgery.Article content OTTAWA — The Toronto Blue Jays added some excitement to Canada Day long weekend with news that centre fielder Kevin Pillar has signed with them for three years at $6.5 million.
